Valliani Jewelers - Shopify Privacy & Compliance Documentation

Purpose This document summarizes Shopify's recommended privacy, consent, cookie, and tracking configuration for your store based on your discussions with Shopify Support.

Current Store Setup

? Shopify Customer Privacy enabled.? Privacy Policy published.? Shopify Cookie Banner enabled (Automated).? Data Sharing Opt-Out page enabled.? Shopify Network Intelligence enabled.? No custom Google Analytics, Google Tag Manager (GTM), Meta Pixel, or other tracking code added manually in the theme.? Google & YouTube official Shopify app installed.? Facebook & Instagram official Shopify app installed.

Shopify's Recommendation

Shopify confirmed that this configuration follows their recommended baseline privacy framework for a standard Shopify store. Their built-in privacy tools are the recommended first-party solution for consent management.

California (CCPA/CPRA)

For stores advertising to California residents:? Keep the Cookie Banner enabled.? Keep the Data Sharing Opt-Out page enabled.? Keep the Privacy Policy updated.? Allow customers to manage privacy preferences. These are key components of Shopify's privacy framework for U.S. state privacy laws.

Google & Meta Tracking

Preferred implementation:? Use only the official Google & YouTube app.? Use only the official Facebook & Instagram app.? Avoid manually adding Google Analytics, GTM, Meta Pixel, or conversion scripts into the theme.? Official integrations are designed to work with Shopify's consent framework.

Consent Management

When customers decline non-essential cookies, Shopify's consent framework is intended to signal supported integrations appropriately. Google Consent Mode v2 depends on correct Customer Privacy configuration and supported implementations.

Third-Party Cookie Apps

Shopify did not recommend installing a third-party Consent Management Platform (CMP) for your current setup. Apps such as Pandectes, Consentmo, or Avada are optional and mainly useful if you need:? Cookie scanning? Consent logs? Advanced banner customization?

Enterprise reporting For your current setup, Shopify's built-in tools are sufficient.

Before Launching Ads

1. Connect Google & YouTube app. 2. Connect Facebook & Instagram app. 3. Verify Privacy Policy mentions Google Analytics, Google Ads, and Meta Pixel. 4. Test the store: - Before consent - After accepting - After declining (where applicable) 5. Avoid duplicate tracking scripts.

Expected Behaviour

After consent tools are enabled: ? Analytics may report fewer sessions. ? Marketing conversions may decrease. ? Browser privacy protections can affect attribution. Shopify states this is expected behaviour.

Best Practices

? Keep Shopify privacy tools enabled. ? Keep Data Sharing Opt-Out page live. ? Use official Shopify integrations. ? Do not duplicate tracking code. ? Review privacy policy whenever new marketing tools are added. ? Periodically test consent behaviour.

Final Summary

Overall assessment: ? Current setup aligns with Shopify's recommended baseline. ? No third-party CMP is required for your current implementation. ? Complete Google & Meta app connections before running campaigns. ? Maintain documentation of your privacy configuration for future audits.
